

How to prepare data for batch testing

This guide will help you prepare the data necessary for batch testing with Veriff.

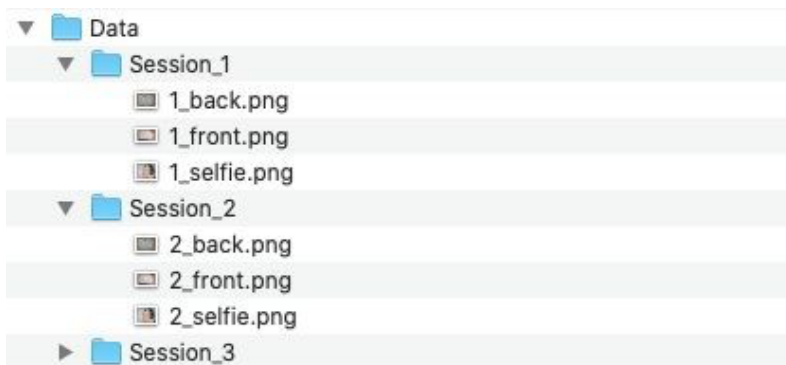

Once the data is prepared in the proper format, your Veriff contact will provide instructions on how to share the encrypted file.

1. Pre-requisites

Veriff needs the following images for each session

1. **Document front** – Front side of the Document – required *
2. **Document back** – Back side of the Document – required *
3. **Face** - Selfie with Document – required *
4. Customer side UUID - Session reference that will allow you to link Veriff's results later in a side by side comparison - optional
5. For optimal test results, we suggest including at least 500 sessions in your file

Example structure:

See how the data is structured here:

- **Folder** name contains customer side session **UUID**
- **Picture** name must contain the **type** in the name. (back, front, selfie)

Notes: Naming must be consistent for all sessions.

The UUID can also be in filename. Example: *session1_back.jpg*

*This needs to be agreed on before generating your test sessions.
