

How to prepare data for batch testing

Here is a guide how you should prepare data for batch testing.

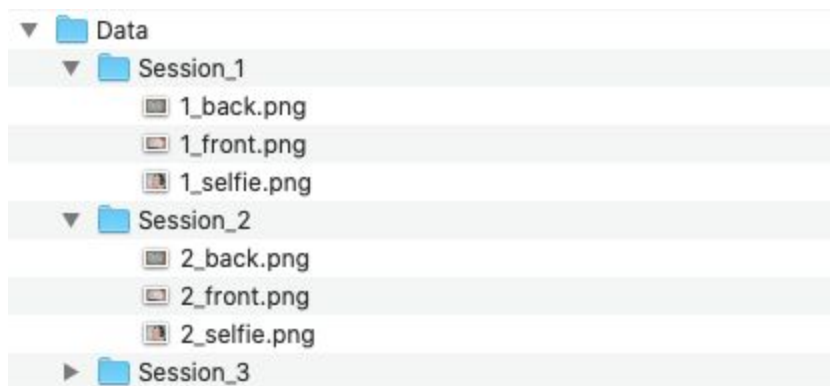

Once data is prepared you can agree the details of how to deliver it to Veriff with your contact person.

1. Pre-requisites

We need following images for each session

1. **Document front** – Front side of the Document – required *
2. **Document back** – Back side of the Document – required *
3. **Face** - Selfie with Document – required *
4. Customer side UUID - Sessions reference if you wish to link the results later on your side
- optional

Example structure:

Here you can see how this data is structured:

- **Folder** name contains customer side session **UUID**
- **Picture** name must contain the **type** of it in the name. (back, front, selfie)

Notes: Naming must be consistent for all sessions.

The UUID can also be in filename. Example: *session1_back.jpg* but this needs to be agreed which one should we use when generating test sessions.
